

ROBATIC®, ROBA®-quick ROBA®-takt

**Electromagnetic Clutches and Brakes,
Clutch Brake Units**

- *High torque capacity*
- *Low wear*
- *Compact construction*
- *Easy assembly and maintenance*

mayr® – your reliable partner

What is your definition of reliability?

We define reliability as the highest product quality and competent service from the initial contact right up to the after-sale service

- Largest variety in selection of standard products
- Market leader's competence arising from decades of experience in the development, production and application of power transmission products
- Optimum product selection due to our expertise in design and calculation
- Reliable component dimensioning
- Intelligent platform (modular construction)
- High flexibility for individual requests and customer-tailored solutions
- Quality-inspected suppliers
- Modern, highly robust materials
- In-house production
- 100 % quality control
- Certified according to DIN EN ISO 9001:2000
- Personal supervision from the first contact right up to the after-sale service
- Worldwide local service network
- CAD-files available online to save time and costs during construction
- 24-hour delivery service for preferred products
- Short delivery times and on-time delivery
- Unlimited replacement part availability worldwide

Your advantages when using electromagnetic ROBATIC[®]-clutches, ROBA[®]-quick brakes and ROBA[®]-takt clutch brake units

● Easy integration into your machine:

The optimised magnetic circuit minimises the magnetic leakage flux. The high power density and torque security based on it allow compact dimensions and an easy integration in your construction.

● High reliability and operational safety:

The switching behaviour is constant during the entire service lifetime. Therefore, the positioning accuracy and reliability of the clutches or brakes respectively and herewith the operational security of your machine are increased.

● Less operating expenses and maintenance charges:

The large friction surface and the smooth switching behaviour increase the wear resistance. Therefore, the clutches and brakes are maintenance-free until the friction surfaces are worn down. There is no re-adjustment work and the resulting operational interruptions. Therefore, the operating expenses and maintenance charges are very low.

● Increase of productivity:

Short switching times allow high switching frequencies and increase the productivity of your machine.

Total Quality Management

Product Quality

Every delivery which leaves our firm has been subjected to a careful quality inspection, meaning that you are able to rely 100 % on mayr[®] products. If required, we pre-adjust our clutches and brakes accurately to the requested values and confirm the product characteristics with an Inspection Report.

Quality Management

mayr[®] uses the term quality to describe its products and services. Certification of our quality management confirms the quality-consciousness of our colleagues at every level of the company.

Our integrated management system is certified according to DIN EN ISO 9001:2000 (Quality) and DIN EN ISO 14001 (Environment) and complies with the OHSAS 18001/OHRIS (Occupational Health and Safety) demands.

All products are subject to comprehensive inspections and tests regarding loads. Only after having passed the strongest long-time tests and when they fully meet all the technical requirements and proof their reliability they are included in our delivery programme.

Please Observe:

According to german notation, decimal points in this document are represented with a comma (e.g. 0,5 instead of 0.5).

Description and Operating Conditions

1. The catalogue values, in particular the values for the nominal torque, are reference values and may deviate in individual cases.
2. During dimensioning, please contact the manufacturers for consultation on installation conditions, torque fluctuations, permitted friction work, run-in behaviour, wear and ambient conditions.
3. The clutches and brakes are designed for dry running. If the friction surfaces come into contact with oil, grease or similar substances, there may be a severe decrease in torque.
4. When the devices are switched off, voltage peaks may occur due to the counter-induction on the magnetic coils, causing in extreme cases damage to the magnetic coil and therefore to the components. For this reason, excess voltage must be damped using a suitable “protective circuit” (e.g. using a varistor).
5. The surfaces on the clutches and the brakes are corrosion-protected except for the friction surfaces. However, in operation in extreme ambient conditions or in outdoor conditions with direct weather influences, additional protective measures are necessary.
6. The connection cable or connection strands on the clutches and brakes have a surface coating which is not resistant against all influences. After contact with chemical substances, please check compatibility.
7. The clutches and brakes are designed for a relative duty cycle of 100 %.

Torque Characteristics

In new condition, c. 50 % of the catalogue nominal torque (M_2) is transmitted.

The components reach the catalogue nominal torque when the friction surfaces are run in. As a rough guideline value, c. 100 – 200 switchings in dynamic operation, a typical speed (c. 50 to 1000 rpm) and a medium friction work (see Table 1) can be given.

Longer slipping of the clutch or brake is to be avoided, especially at low speeds, as this can cause scoring formation and therefore damage to the friction surfaces. Clutches or brakes used in static or virtually static operation do not reach the nominal torque (M_2).

If requested, the clutches or brakes can also be run in at the place of manufacture. This is most expedient for Type 540.140 with complete bearing.

However, Types 500.1_ _ and 520.1_ _ can also be run in under certain conditions. For this, please ensure exact installation customer-side according to the regulations in order to reproduce the friction conditions as precisely as possible. At the same time, the “friction carbon” produced must not be rubbed off. If the clutch is run in to the nominal torque at the place of manufacture and then operated in static or virtually static mode, please allow for a drop to c. 60 – 70 % of the nominal torque. This is the case if the clutch or brake falls below the speed or friction work (Q_f) stated in Table 1.

For static and virtually static applications, we therefore recommend our “double-flow designs“ construction series 500.3 _ _0 (see pages 12/13).

Size	Friction work Q_f [J]	Clutch or brake speed n_{min} [rpm]
3	16	300
4	29	250
5	55	200
6	105	160
7	200	130
8	380	120
9	600	100

Run-in Conditions

For running in, different procedures can be used according to the Type design. An “artificial” run-in is to be carried out if a run-in procedure is not possible in the machine due to the type of application (see section “Torque Characteristics”), e.g. due to insufficient friction work, speed or switching frequencies.

For the run-in conditions of the individual clutch and brake types, please see the respective Installation and Operational Instructions on our website www.mayr.com

Electrical Connection and Wiring

DC current is necessary for the operation of the brake. The coil voltage is indicated on the Type tag as well as on the brake body and is designed according to the DIN IEC 60038 ($\pm 10\%$ tolerance). Operation is possible both via alternating voltage in connection with a rectifier or with another suitable DC supply. Dependent on the brake equipment, the connection possibilities can vary. Please follow the exact connections according to the Wiring Diagram. The manufacturer and the user must observe the applicable directives and standards (e.g. DIN EN 60204-1 and DIN VDE 0580). Their observance must be guaranteed and double-checked.

Electrical Wiring

24 VDC and 104 VDC can be selected as standard voltages.

24 VDC: Operation with a power supply unit of 24 VDC

104 VDC: Half-wave rectifier with 230 VAC mains voltages

Earthing Connection

The brake is designed for Protection Class I. This protection covers not only the basic insulation but also the connection of all conductive parts to the PE conductor on the fixed installation. If the basic insulation fails, no contact voltage will remain. Please carry out a standardized inspection of the PE conductor connections to all contactable metal parts.

Device Fuses

To protect against damage from short circuits, please add suitable device fuses to the mains cable.

Protection Circuit

When using DC-side switching, the coil must be protected by a suitable protective circuit according to VDE 0580.

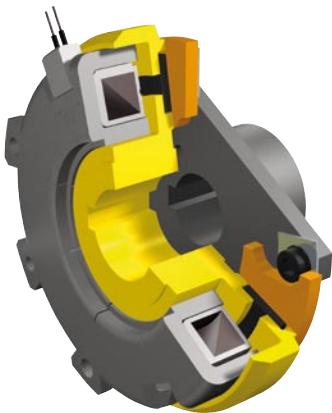

This is achieved by using a sufficiently dimensioned varistor, which has already been integrated into the **mayr® rectifier**.

To protect the switching contact from consumption when using DC-side switching, additional protective measures may be necessary (e.g. series connection of switching contacts). The switching contacts used should have a minimum contact opening of 3 mm and should be suitable for inductive load switching. Please make sure on selection that the rated voltage and the rated operation current are sufficient. Depending on the application, the switching contact can also be protected by other protective circuits (e.g. **mayr® spark quenching units**), although this may of course then alter the switching times.

Constant switching performance throughout the entire service lifetime

High torque security

due to an optimised magnetic circuit and the new design of the ROBATIC®-clutch. Therefore, higher capacities due to less magnetic leakage flux.

Half the wear

due to large friction surfaces and smooth switching behaviour, the ROBATIC®-clutch has a higher wear resistance (approx. 100 %).

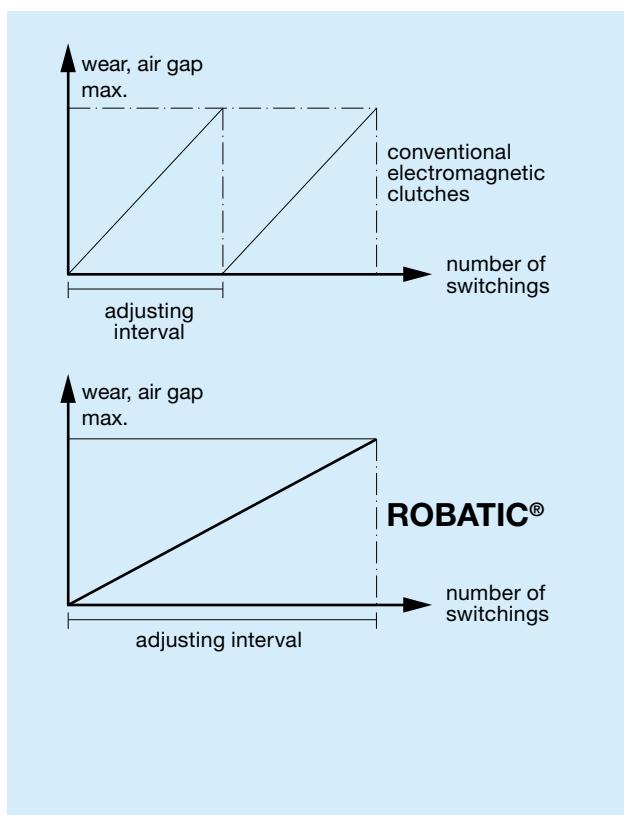

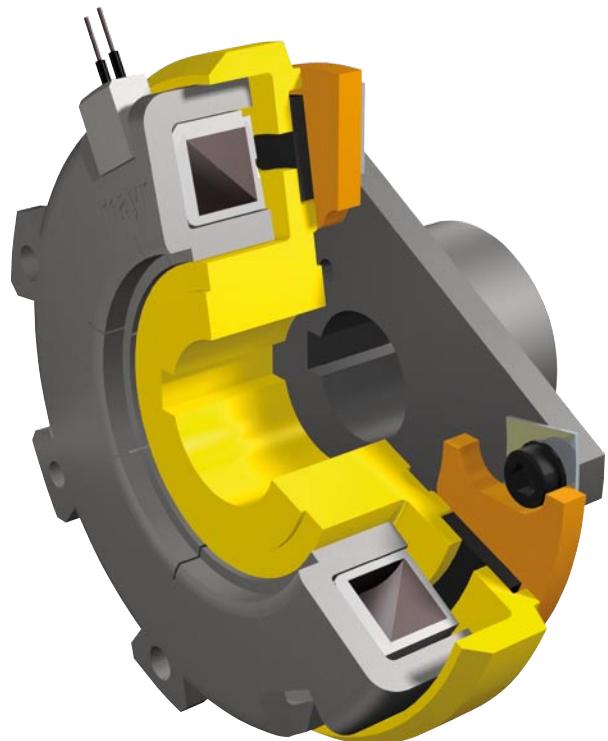

Large internal diameters of the magnetic coil bodies

therefore large permitted shaft diameters

Low noise

Short switching times/high switching frequencies

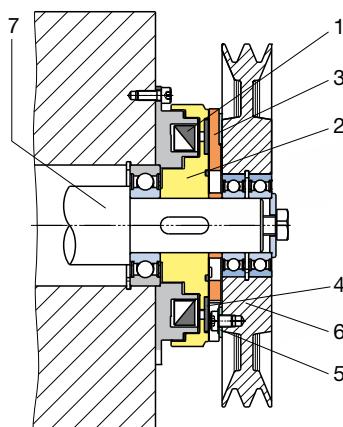

Correct function up to wear limit

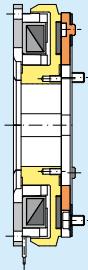

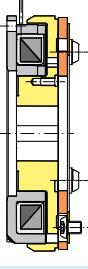

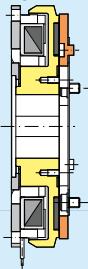

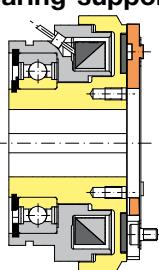

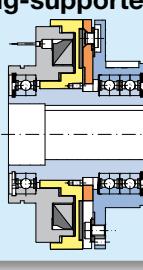

Functional principle

ROBATIC®-clutches are energised to engage, electromagnetic pole face units. When DC voltage is applied to the magnetic coil (1), a magnetic field is built up, the armature disk (3) is attracted to the rotor (2) and the friction lining (4). The torque is transmitted via friction locking.

The torque is transmitted from the drive element (6) via the armature disk (3) and the rotor (2) to the output shaft (7). After having de-energised the coil, the membrane spring (5) draws back the armature disk (3) to the drive element (e.g. belt pulley), and the torque transmission is then disconnected.

e	0,25	0,3	0,2	0,35	0,5	0,55	0,6

Table 1 Adjustment of the air gaps

The dimension "a" (Fig. 1) must be adjusted according to Table 1. Please ensure that the shaft is fastened axially, since otherwise the dimension "a" will change and cause the rotor to brush against the armature disk or the coil carrier.

The air gap "e" is selected so that a brushing of the rotor against the coil carrier is not possible when keeping to the permitted centre offsets V and V1 (see Table "Dimensions").

Design:

ROBATIC®-electromagnetic clutches are manufactured according to the electric protection IP 54 specification and the insulation material class F up to 155 °C for coil, moulding compound and connection strands as well as insulation class B +130 °C for the magnetic coil plastic-coated. The friction linings are asbestos-free, the surfaces of coil carrier, rotor and flange hub are phosphated. The armature disk is gas nitro-carburized and the transmission spring is made of stainless steel. The drive elements should be made of magnetically poorly transmitting material to avoid magnetic leakage flux and subsequent power reduction.

ROBATIC®-electromagnetic clutches are used for dry running. The torque is transmitted via the connection of the armature disk on the iron poles and the friction lining of the rotor (except the double-flow ROBATIC® clutch without friction lining, Type 500.30_.0).

When coupling two shafts, the eccentricity "V" of the shafts according to Table 2 must not be exceeded. The larger the misalignment "V" the more the torque decreases and the hotter the friction surface becomes. In the case of this arrangement care must be taken that both shafts have no axial backlash since, otherwise, a brushing of the rotor would also be possible. The flange hub is kept axially by means of a set screw (on set 90 ° to the key). The "V"-values are indicated again in the Technical Data of the individual clutches.

	Size						
	3	4	5	6	7	8	9
V	0,05	0,05	0,05	0,05	0,1	0,1	0,1

Table 2 Permitted shaft misalignments

Please observe:

The run-in conditions or the minimum speed must be observed (see page 4).

The friction surfaces have to be absolutely free of oil and grease, as otherwise, the torque drops significantly. The air gap "a" (Fig. 1) has to be checked periodically. The clutch does not function correctly, if the max. working air gap is exceeded (see Table 4, page 25).

Assembly and maintenance should be carried out by well trained specialists.

Clutch size calculation

Formulas

1. Drive torque

$$M_A = \frac{9550 \times P_A}{n} \quad [\text{Nm}]$$

2. Required torque

$$M_{\text{req.}} \geq K \times M_A \quad [\text{Nm}]$$

3. Switchable torque of the clutch (acc. to diagram 1, page 24)

$$M_S \geq M_{\text{req.}} \quad [\text{Nm}]$$

4. Mass moment of inertia

$$I = I_{\text{own}} + I_{\text{add.}} \quad [\text{kgm}^2]$$

5. Acceleration torque of the clutch

$$M_a = M_S (+) M_L \quad [\text{Nm}]$$

6. Acceleration time

$$t_a = \frac{I \times n}{9,55 \times M_a} + t_1 \quad [\text{sec}]$$

7. Max. switching frequency per hour (dependent on time)

$$S_{h \max} = \frac{1}{t_{\text{VM}} + (t_a + t_2) \times 1,2} \times 3600 \quad [\text{h}^{-1}]$$

8. Friction work per acceleration

$$Q_a = \frac{I \times n^2}{182,4} \times \frac{M_s}{M_a} \quad [\text{J}]$$

9. Examination of the selected clutch size in diagram 2 (page 24 friction power diagram).

Intersection friction work / switching frequency must be below the friction power curve! If it is above, the next size has to be selected and re-calculated from point 3 on.

$$Q_a < Q_E \quad [\text{J}]$$

10. Number of switchings until re-adjustment

$$Z_n = \frac{Q_1}{Q_a} \times (a_n - a) \quad [-]$$

11. Number of switchings until wear limit

$$Z = \frac{Q_{\text{tot.}}}{Q_a} \quad [-]$$

Table 3,
page 25

Table 4,
page 25

Table 4,
page 25

Calculation example

Data:

Input power	$P_A = 3 \text{ kW}$
Input speed	$n = 1400 \text{ rpm}$
Load torque output	$M_L = 15 \text{ Nm}$
Additional mass moment of inertia	$I_{\text{add.}} = 0,15 \text{ kgm}^2$
Braking time of the machine	$t_{VM} = 1,5 \text{ [sec]}$
180 switchings per hour	

Drive torque

$$M_A = \frac{9550 \times P_A}{n} = \frac{9550 \times 3}{1400} = 20,5 \text{ [Nm]}$$

Required torque

$$M_{\text{req.}} = K \times M_A = 2 \times 20,5 = 41 \text{ [Nm]}$$

Determined clutch size (acc. to diagram 1) = Size 6

$$M_S \geq M_{\text{req.}} = 47 \text{ [Nm]}$$

Selected clutch = Size 6, type 500.200.0

Mass moment of inertia

$$I = I_{\text{own}} + I_{\text{add.}} = 0,001756 + 0,15 = 0,151756 \text{ [kgm}^2\text{]}$$

Acceleration torque of the clutch

$$M_a = M_S - M_L = 47 - 15 = 32 \text{ [Nm]}$$

Acceleration time of the clutch

$$t_a = \frac{I \times n}{9,55 \times M_a} + t_1^* = \frac{0,151756 \times 1400}{9,55 \times 32} + 0,15 = 0,845 \text{ [sec]}$$

* Switching times t_1 and t_2 from Table 3, page 25 = without overexcitation

Max. switching frequency per hour

$$S_{h \max} = \frac{1}{t_{VM} + (t_a + t_2^*) \times 1,2} \times 3600$$

$$S_{h \max} = \frac{1}{1,5 + (0,845 + 0,060) \times 1,2} \times 3600 = 1392 \text{ [h}^{-1}\text{]}$$

Friction work per acceleration

$$Q_a = \frac{I \times n^2}{182,4} \times \frac{M_S}{M_a}$$

$$Q_a = \frac{0,151756 \times 1400^2}{182,4} \times \frac{47}{32} = 2395 \text{ [J]} \leq Q_E$$

The point of intersection determined in diagram 2 must be located in or under the characteristic curve of the selected clutch.

Switching frequency: 180 switchings per hour = permitted

Number of switchings until adjustment

$$Z_n = \frac{Q_1}{Q_a} \times (a_n - a)$$

$$Z_n = \frac{57 \times 10^7}{2395} \times (1,2 - 0,3) = 214196 \text{ switchings}$$

Number of switchings until wear limit

$$Z = \frac{Q_{\text{tot.}}}{Q_a} = \frac{100 \times 10^7}{2395} = 417536 \text{ switchings}$$

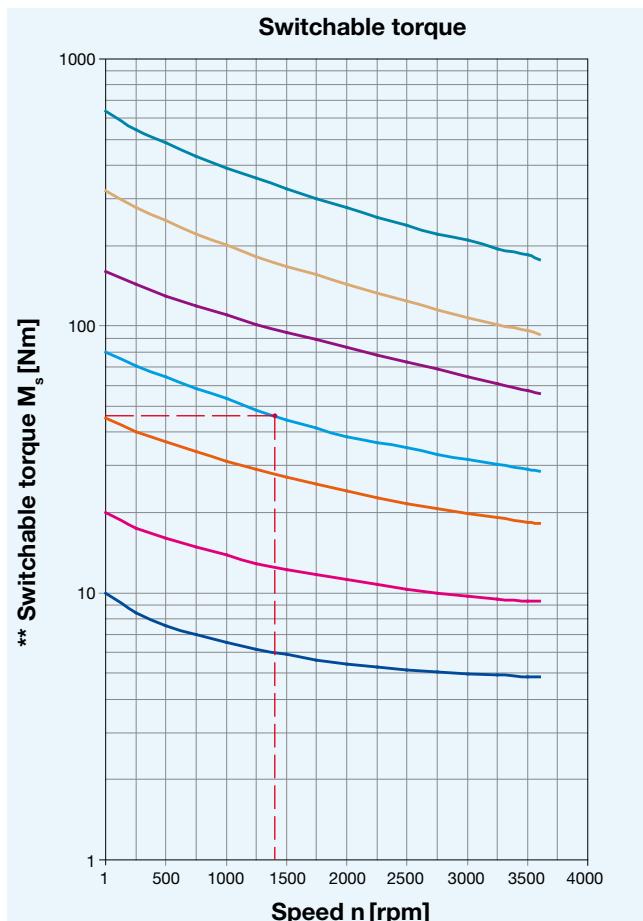

Diagram 1 (not valid for Type 500.30_)

** Friction surfaces have been run in

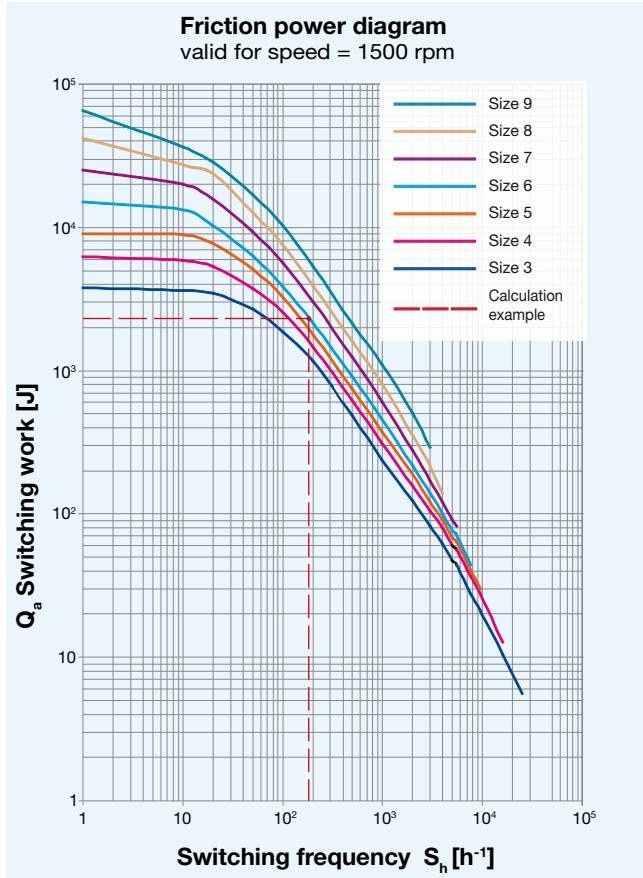

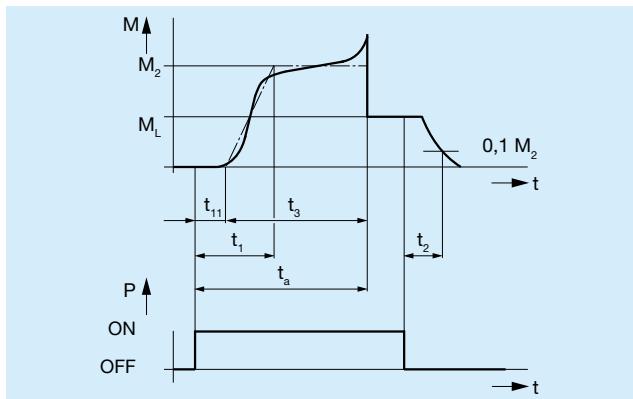

Diagram 2 (not valid for Type 500.30_)

Switching times

The switching times stated in Table 3 have been determined by comprehensive series of tests. They are valid for switching DC-side with nominal air gap and warm coil. Deviations depend on the respective installation situation, ambient temperatures, release path and the type of rectification with which the corresponding clutch is operated.

Table 4

1) The friction work data are not valid for Type 500.30_0 double-flow design.

Please Observe!

Wear values can only be **recommended values** due to operating parameters, such as sliding speed, pressing or temperature.

Application

Rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop®, ROBA-quick®, ROBATIC®), electromagnets, electrovalves, contactors, switch-on safe DC motors, etc.

Function

The AC input voltage (VAC) is rectified (VDC) in order to operate DC voltage units. Also, voltage peaks, which occur when switching off inductive loads and which may cause damage to insulation and contacts, are limited and the contact load reduced.

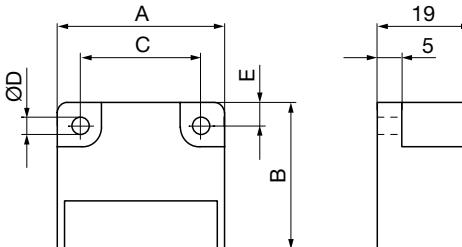

Electrical Connection (Terminals)

- 1 + 2 Input voltage
- 3 + 4 Connection for an external switch for DC-side switching

Installation conditions			The installation position can be user-defined. Please ensure sufficient heat dissipation and air convection! Do not install near to sources of intense heat!				

Application

Reduces spark production on the switching contacts occurring during DC-side switching-off of inductive loads.

- Voltage limitation according to VDE 0580 2000-07, Item 4.6.
- Reduction of EMC-disturbance by voltage rise limitation, suppression of switching sparks.
- Reduction of brake engagement times by a factor of 2-4 compared to free-wheeling diodes.

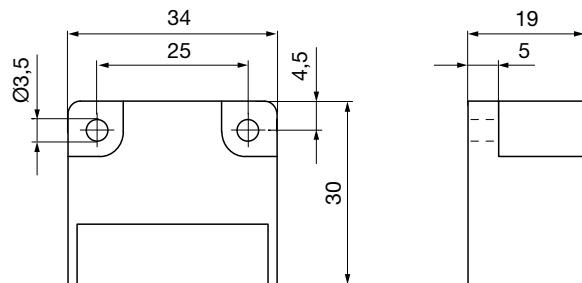

Function

The spark quenching unit will absorb voltage peaks resulting from inductive load switching, which can cause damage to insulation and contacts. It limits these to 70 V and reduces the contact load. Switching products with a contact opening distance of > 3 mm are suitable for this purpose.

Exact positioning over the entire service lifetime

High torque security

due to an optimised magnetic circuit and new design of the ROBA®-quick. Therefore higher capacities due to less magnetic leakage flux.

Exact positioning until wear limit

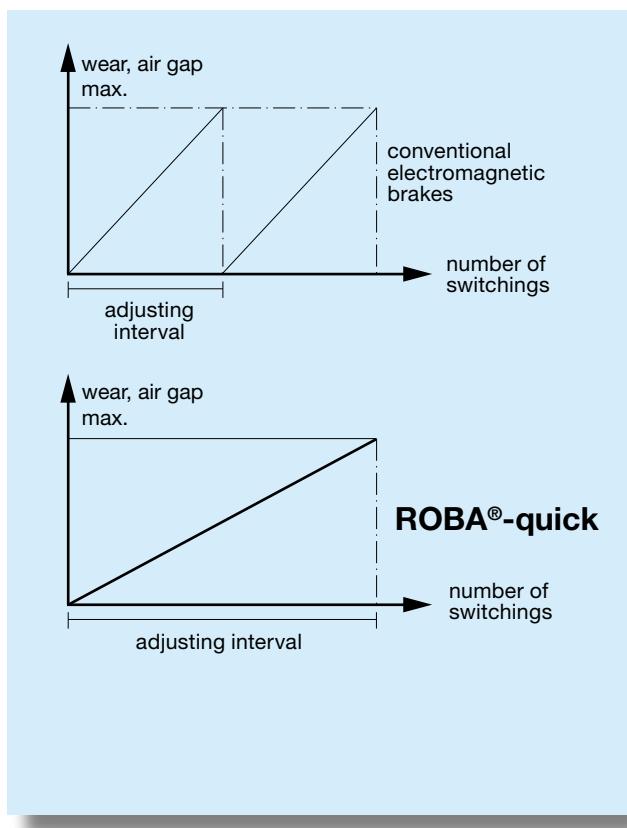

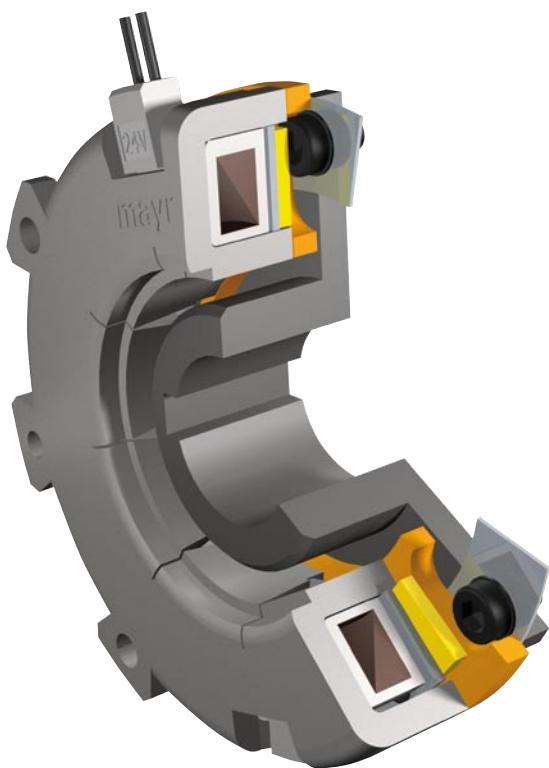

ideal for positioning operations

Large internal diameters of the magnetic coil bodies

Therefore large permitted shaft diameters and few magnetic field losses

Low noise

Short switching times/high switching frequency

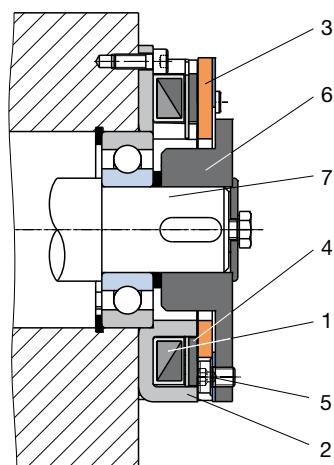

Functional principle

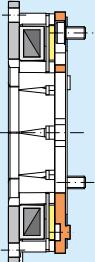

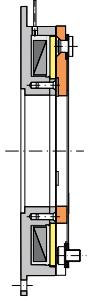

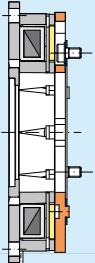

ROBA®-quick are “energise to engage”, electromagnetic pole face brakes.

When DC voltage is applied to the magnetic coil (1), a magnetic field is built up. The armature disk (3) is attracted to the brake coil carrier with friction lining (4). The brake torque runs from the coil carrier (2) via friction lining (4), armature disk (3) and membrane transmission spring (5) to the flange (6) and the shaft.

If the magnetic coil is de-energised, the membrane transmission spring (5) draws the armature disk (3) back to the flange (6). The brake is released and the shaft (7) can run freely.

Table 1 Adjustment of the air gaps

The dimension "a" (Fig. 1) must be adjusted according to Table 1. Please ensure that the shaft is fastened axially, since otherwise the dimension "a" will change and cause the armature disk to band against coil carrier.

Design:

ROBA®-quick electromagnetic brakes are manufactured according to the electric protection IP 54 specification and the insulation material class F up to 155 °C for coil, moulding compound and connection strands as well as insulation class B +130 °C for the magnetic coil plastic-coated. The friction linings are asbestos-free, the surfaces of coil carrier and flange hub are phosphated. The armature disk is gas nitro-carburized and the transmission spring is made of stainless steel.

ROBA®-quick electromagnetic brakes are used for dry running. The torque is transmitted by friction between armature disk and the iron poles and the friction lining surfaces of the coil carrier.

When braking the eccentricity "V" according to Table must not be exceeded. The larger the displacement "V" the more the torque decreases and the hotter the friction surface becomes. In the case of arrangement according to table care must be taken that the coil carrier and shaft have no axial backlash since otherwise a brushing of the coil carrier would be possible. The flange hub is kept axially by means of a set screw (on set 90° to the key). The "V"-values are indicated again in the Technical Data of the individual brakes.

	Size						
	3	4	5	6	7	8	9
V	0,05	0,05	0,05	0,05	0,1	0,1	0,1

Table 2 Permitted shaft misalignments**Please observe:**

The run-in conditions or the min. speed must be observed (see page 4).

The friction surfaces have to be absolutely free of oil and grease as otherwise, the torque drops significantly. The air gap "a" (Fig. 1) has to be checked periodically. The brake does not function correctly if the max. working air gap (see Table 4, page 39) is exceeded.

Assembly and maintenance have to be carried out by well-trained specialists.

Brake size calculation

Formulas

1. Drive torque

$$M_A = \frac{9550 \times P_A}{n} \quad [\text{Nm}]$$

2. Required torque

$$M_{\text{req.}} \geq K \times M_A \quad [\text{Nm}]$$

3. Switchable torque of the brake (acc. to diagram 1, page 38)

$$M_S \geq M_{\text{req.}} \quad [\text{Nm}]$$

4. Mass moment of inertia

$$I = I_{\text{own}} + I_{\text{add.}} \quad [\text{kgm}^2]$$

5. Deceleration torque of the brake

$$M_v = M_S (+) M_L \quad [\text{Nm}]$$

6. Deceleration time

$$t_v = \frac{l \times n}{9,55 \times M_v} + t_1 \quad [\text{sec}]$$

7. Max. switching frequency per hour (dependent on time)

$$S_{h \max} = \frac{1}{t_{aM} + (t_v + t_2) \times 1,2} \times 3600 \quad [\text{h}^{-1}]$$

8. Friction work per deceleration

$$Q_v = \frac{l \times n^2}{182,4} \times \frac{M_s}{M_v} \quad [\text{J}]$$

9. Examination of the selected brake size in diagram 2 (page 38 friction power diagram).

Intersection friction work / switching frequency must be below the friction power curve! If it is above, the next size has to be selected and re-calculated from point 3 on.

$$Q_v < Q_E \quad [\text{J}]$$

10. Number of switchings until re-adjustment

$$Z_n = \frac{Q_1}{Q_v} \times (a_n - a) \quad [-]$$

11. Number of switchings until wear limit

$$Z = \frac{Q_{\text{tot.}}}{Q_v} \quad [-]$$

Key:

P_A	[kW]	drive power
M_A	[Nm]	drive torque
M_v	[Nm]	deceleration torque of the brake
$M_{\text{req.}}$	[Nm]	required torque
M_L	[Nm]	load torque (+ = drop load) (- = lift load)
M_S	[Nm]	switchable torque of the brake (diagram 1, page 38)
n	[rpm]	drive speed
K		safety factor ≥ 2
I	[kgm ²]	mass moment of inertia
I_{own}	[kgm ²]	own mass moment of inertia ("Technical data")
$I_{\text{add.}}$	[kgm ²]	additional mass moment of inertia
t_v	[sec]	deceleration time
t_{aM}	[sec]	acceleration time of the machine
t_1	[sec]	switch-on time of the brake
t_2	[sec]	switch-off time of the brake
$S_{h \max}$	[h ⁻¹]	max. switching frequency per hour (dependent on time)
$Q_{\text{tot.}}$	[J]	total friction work (acc. Table 4, page 39)
Q_v	[J]	friction work per deceleration
Q_E	[J]	perm. friction work for single switching
Q_1	[J/mm]	friction work until 1 mm wear
Z_n		number of switchings until re-adjustment
Z		number of switchings until wear limit
a	[mm]	nominal air gap
a_n	[mm]	max. working air gap

Table 3,
page 39

Table 4,
page 39

Table 4,
page 39

Calculation example

Data:

Input power	$P_A = 3 \text{ kW}$
Input speed	$n = 1400 \text{ rpm}$
Load torque output	$M_L = 15 \text{ Nm}$
Additional mass moment of inertia	$I_{\text{add.}} = 0,15 \text{ kgm}^2$
Acceleration time of the machine	$t_{\text{aM}} = 1,5 \text{ [sec]}$
350 switchings per hour	

Drive torque

$$M_A = \frac{9550 \times P_A}{n} = \frac{9550 \times 3}{1400} = 20,5 \text{ [Nm]}$$

Required torque

$$M_{\text{req.}} = K \times M_A = 2 \times 20,5 = 41 \text{ [Nm]}$$

Determined brake size (acc. to diagram 1) = Size 6

$$M_S \geq M_{\text{req.}} = 47 \text{ [Nm]}$$

selected brake = Size 6, Type 520.200.0

Mass moment of inertia

$$I = I_{\text{own}} + I_{\text{add.}} = 0,001756 + 0,15 = 0,151756 \text{ [kgm}^2\text{]}$$

Deceleration torque of the brake

$$M_v = M_S + M_L = 47 + 15 = 62 \text{ [Nm]}$$

Deceleration time of the brake

$$t_v = \frac{I \times n}{9,55 \times M_v} + t_1^* = \frac{0,151756 \times 1400}{9,55 \times 62} + 0,10 = 0,46 \text{ [sec]}$$

* Switching times t_1 and t_2 from Table 3, page 25 = without overexcitation

Max. switching frequency per hour

$$S_{h \max} = \frac{1}{t_{\text{aM}} + (t_v + t_2^*) \times 1,2} \times 3600$$

$$S_{h \max} = \frac{1}{1,5 + (0,46 + 0,060) \times 1,2} \times 3600 = 1695 \text{ [h}^{-1}\text{]}$$

Friction work per deceleration

$$Q_v = \frac{I \times n^2}{182,4} \times \frac{M_S}{M_v}$$

$$Q_v = \frac{0,151756 \times 1400^2}{182,4} \times \frac{47}{62} = 1236 \text{ [J]} \leq Q_E$$

The point of intersection determined in diagram 2 must be located in or under the characteristic curve of the selected brake.

Switching frequency: 350 switchings per hour = permitted

Number of switchings until adjustment

$$Z_n = \frac{Q_1}{Q_v} \times (a_n - a)$$

$$Z_n = \frac{57 \times 10^7}{1236} \times (1,2 - 0,3) = 415048 \text{ switchings}$$

Number of switchings until wear limit

$$Z = \frac{Q_{\text{tot.}}}{Q_v} = \frac{100 \times 10^7}{1236} = 809061 \text{ switchings}$$

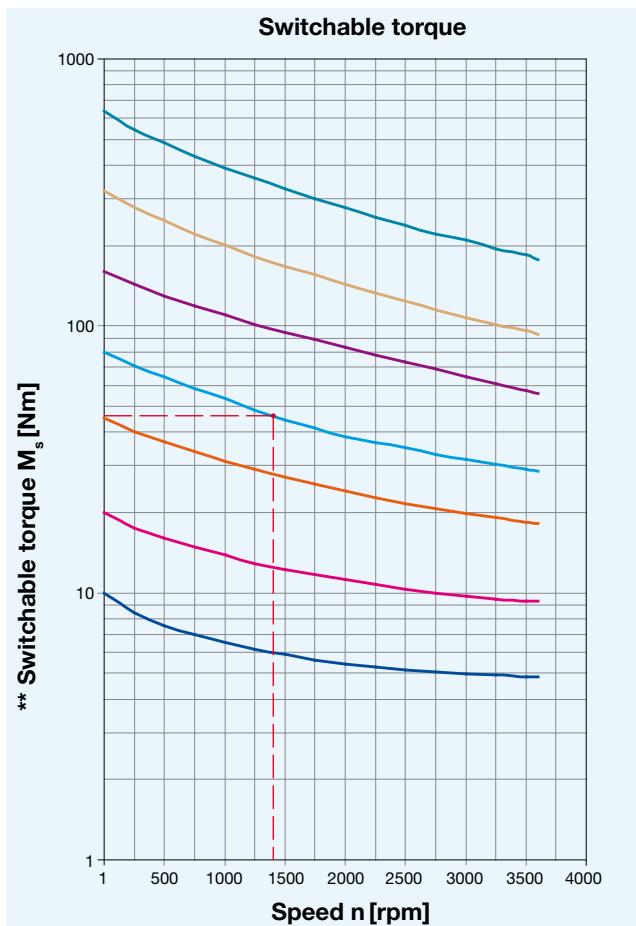

Diagram 1

** Friction surfaces have been run in

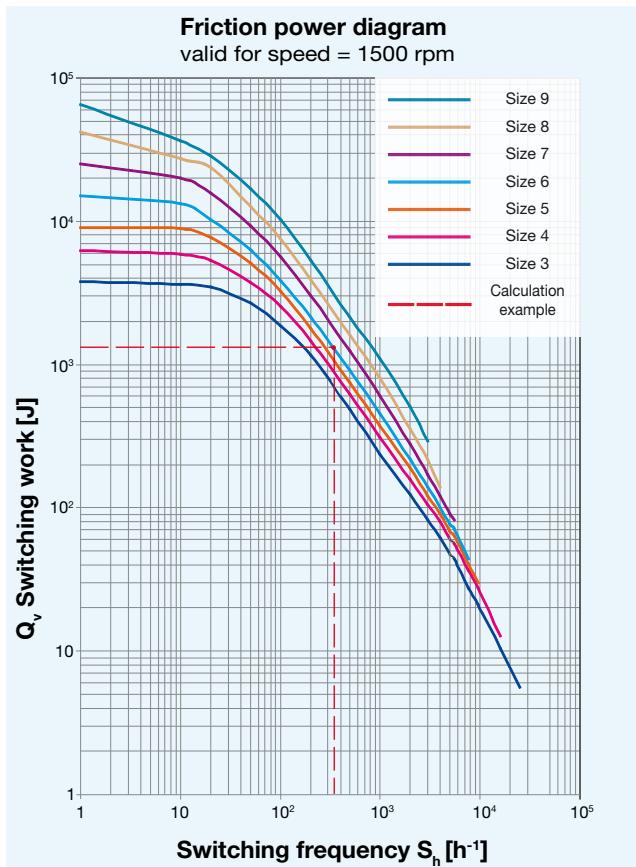

Diagram 2

Switching times

The switching times stated in Table 3 have been determined by comprehensive series of tests. They are valid for switching DC-side with nominal air gap and warm coil. Deviations depend on the respective installation situation, ambient temperatures, release path and the type of rectification with which the corresponding brake is operated.

Switching times			Size						
			3	4	5	6	7	8	9
Without overexcitation	Type 520...--	t_{11} [sec]	0,006	0,008	0,010	0,015	0,025	0,027	0,030
		t_1 [sec]	0,035	0,040	0,055	0,100	0,150	0,245	0,330
		t_2 [sec]	0,010	0,018	0,030	0,060	0,090	0,100	0,140
With overexcitation	Type 520...-.-	t_{11} [sec]	0,002	0,003	0,004	0,006	0,008	0,010	0,015
		t_1 [sec]	0,020	0,022	0,030	0,050	0,075	0,120	0,165

Table 3

Max. working air gap		a_n [mm]	0,6	0,8	1,0	1,2	1,5	1,8	2,0

Table 4

Please Observe!

Wear values can only be **recommended values** due to operating parameters, such as sliding speed, pressing or temperature.

Application

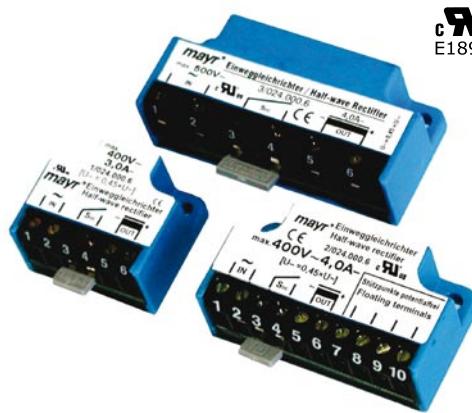

Rectifiers are used to connect DC consumers to alternating voltage supplies, for example electromagnetic brakes and clutches (ROBA-stop®, ROBA-quick®, ROBATIC®), electromagnets, electrovalves, contactors, switch-on safe DC motors, etc.

Function

The AC input voltage (VAC) is rectified (VDC) in order to operate DC voltage units. Also, voltage peaks, which occur when switching off inductive loads and which may cause damage to insulation and contacts, are limited and the contact load reduced.

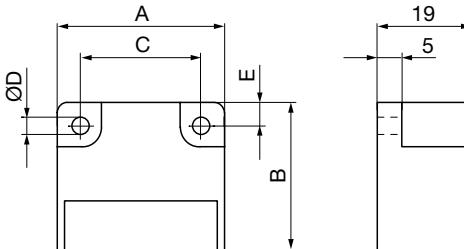

Electrical Connection (Terminals)

Installation conditions		The installation position can be user-defined. Please ensure sufficient heat dissipation and air convection! Do not install near to sources of intense heat!					

Application

Reduces spark production on the switching contacts occurring during DC-side switching-off of inductive loads.

- Voltage limitation according to VDE 0580 2000-07, Item 4.6.
- Reduction of EMC-disturbance by voltage rise limitation, suppression of switching sparks.
- Reduction of brake engagement times by a factor of 2-4 compared to free-wheeling diodes.

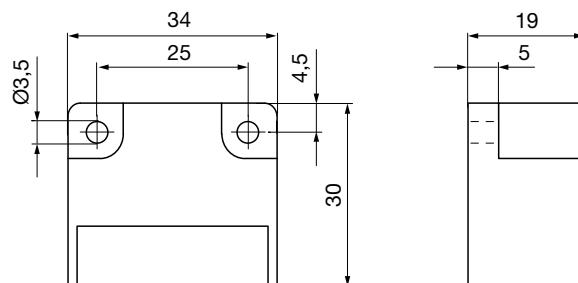

Function

The spark quenching unit will absorb voltage peaks resulting from inductive load switching, which can cause damage to insulation and contacts. It limits these to 70 V and reduces the contact load. Switching products with a contact opening distance of > 3 mm are suitable for this purpose.

The clutch brake module for positioning and synchronising

- Energy-saving and environmentally-friendly
- Positioning accuracy for the entire service lifetime
- High switching frequency
- Maintenance-free during the entire service lifetime
- Low-noise
- Sealed
- Individual variants
 - without flange
 - with cast IEC-flange
 - with hollow shaft

Maintenance-free/ no manual re-adjustment

- Constant switching behaviour, i.e. high positioning accuracy and freedom maintenance over the entire service lifetime
- No downtime due to re-adjustment

High radial shaft end loads

Strengthened bearings

- High radial loads of the input and output shafts permitted

Heat dissipation

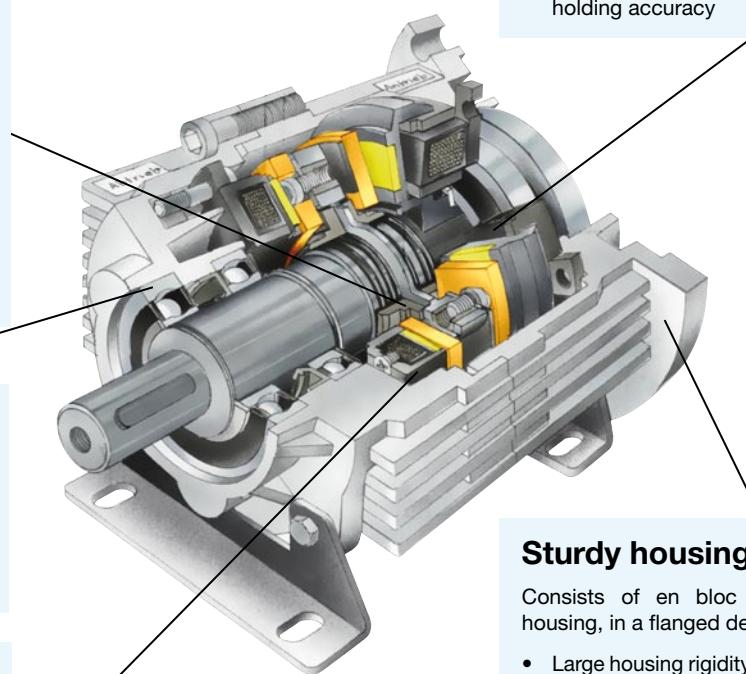

Optimized heat dissipation and large cooling ribs operational

- Optimum operation temperature due to dissipation of the frictional heat
- Constant characteristic operating data

Low leakage flux/ high friction power

Larger magnetic and friction surfaces (asbestos free) with the same dimensions due to the new technology of the clutches and brakes

- Optimised electromagnetic effect, i.e. low leakage flux, faster switching behaviour, less heat build-up and, therefore, constant holding accuracy

Sturdy housing

Consists of en bloc cast two part ribbed housing, in a flanged design with cast flanges

- Large housing rigidity guarantees dimensional stability, even with loads not caused under regular conditions (for example weight load by people)

Functional Principle

The ROBA[®]-takt clutch brake module is an electromagnetic clutch brake unit. Whilst the drive machine runs through continuously, it generates cycle operation via alternating coupling and braking actions.

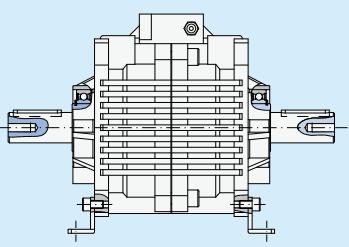

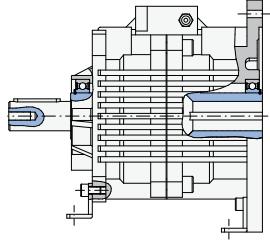

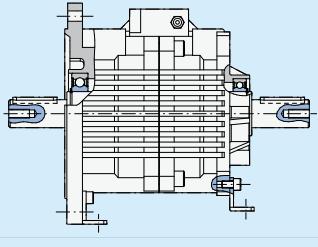

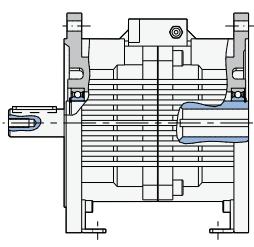

ROBA[®]-takt clutch brake modules guarantee high cycle times.

Due to the completely enclosed construction (Protection IP55), conceived acc. VDE/IEC directives, the ROBA[®]-takt clutch brake module is ideal for all standardized motors and gearboxes.

This means that many different installation positions are possible.

Due to the patented principle of self-readjustment, the ROBA[®]-takt clutch brake module is accurately positioned and maintenance-free over the entire service lifetime.

Installation

Clutch Brake Unit with flange:

The shafts, centring, screw-on pitch circles and diameters of the flanges are designed according to IEC-standard. Input and output sides can be fitted with the corresponding flanges of motor, gearbox or other units without problems, as shown in Fig. 1.

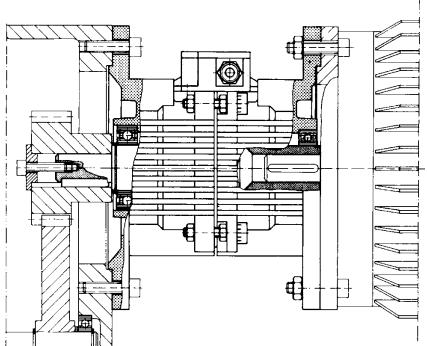

Fig. 1

Installation of the transmission elements:

The drive elements are mounted onto the respective shafts and secured axially via a press cover and a screw screwed into the threaded centre hole of the shaft, see Fig. 2.

For the combination motor shaft - ROBA®-takt hollow shaft, the motor shaft must be greased slightly to prevent frictional corrosion. Extensive force or hammer blows can damage the bearings. Radial loads acting on the shaft via the drive elements must not exceed the maximum allowable values (see heading „permissible shaft load“). Should both radial and axial loads be present on the shaft, the permissible loads must be determined - please contact our engineers.

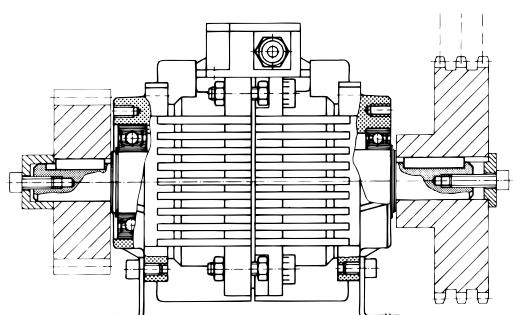

Fig. 2

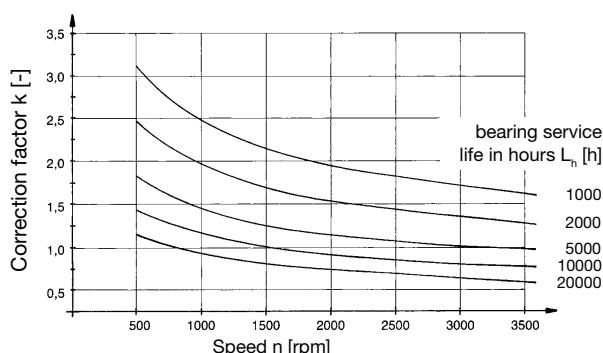

Diagram 1

Permitted shaft loads

The drive elements located on the shafts exert a radial load during operation which has to be absorbed by the bearings of the unit. The load is limited by the required life of the bearings and strength of the shaft (Table 1).

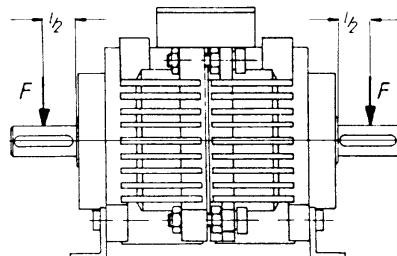

Fig. 3

ROBA®-takt max. permitted radial force F_{\max} [N]	Size				
	3	4	5	6	7
Input shaft without IEC-flange	333	995	2150	2705	5355
Output shaft without IEC-flange	333	1105	2331	2950	6211
Output shaft small IEC-flange	-	-	-	-	-
Output shaft large IEC-flange	333	1105	2331	2950	6211

Table 1: Max. permitted radial force F_{\max} , limited due to the strength of the shaft, application of load midway along shaft.

The application of load is assumed to be midway along the shaft, determining the acceptable radial load. In case of additional axial loads, an extensive calculation is necessary (please contact the manufacturer).

The permitted radial forces stated in Table 2 refer to a speed of $n = 1500$ rpm and a bearing service life $L_h = 10\,000$ hours.

ROBA®-takt Radial force F_N [N]	Size				
	3	4	5	6	7
Input shaft without IEC-flange	436	547	681	819	1149
Output shaft without IEC-flange	788	1052	1484	1685	2861
Output shaft small IEC-flange	840	1134	1586	1785	3115
Output shaft large IEC-flange	788	1052	1484	1685	2861

Table 2: Permitted radial force F_N with speed $n = 1500$ rpm, bearing service life $L_h = 10\,000$ hours assuming load applied midway along shaft.

The permitted force F can be calculated with factor k for other speeds or bearing lifetimes. The factor k is determined from diagram 1.

$$F = k \times F_N \leq F_{\max} \quad [\text{N}]$$

F in N = Permitted radial force

k = Correction factor (diagram 1)

F_N in N = Permitted radial force at $n = 1500$ rpm and bearing service life $L_h = 10\,000$ hours (Table 2)

F_{\max} in N = Max. permitted radial force, limited due to shaft strength (Table 1)

Clutch brake modul size calculation

Formulas

Basis: $M_L = \text{constant}$
 $M_S = \text{constant}$

1. Drive torque

$$M_A = \frac{9550 \times P_A}{n} \quad [\text{Nm}]$$

2. Required torque

$$M_{\text{req.}} \geq K \times M_A \quad [\text{Nm}]$$

3. Pre-selection of the unit size acc. diagram 1 page 54

$$M_S \geq M_{\text{req.}} \quad [\text{Nm}]$$

4. Mass moment of inertia

$$I = I_{\text{own}} + I_{\text{add.}} \quad [\text{kgm}^2]$$

5. Acceleration time input side ($M_A \geq M_S$)

$$t_a = \frac{I \times n}{9,55 \times (M_S \stackrel{(+)}{\cdot} M_L)} + t_1^{(1)} \quad [\text{sec}]$$

6. Braking time output side

$$t_v = \frac{I \times n}{9,55 \times (M_S \stackrel{(-)}{\cdot} M_L)} + t_1^{(2)} \quad [\text{sec}]$$

7. Max. switching frequency per hour (dependent on time)

$$S_{h \max} = \frac{1}{(t_v + t_a) \times 1,2} \times 3600 \quad [\text{h}^{-1}]$$

8. Friction work per acceleration

$$Q_a = \frac{I \times n^2}{182,4} \times \frac{M_s}{M_S \stackrel{(+)}{\cdot} M_L} \quad [\text{J}]$$

$$Q_a < Q_E \quad [\text{J}]$$

9. Friction work per delay

$$Q_v = \frac{I \times n^2}{182,4} \times \frac{M_s}{M_S \stackrel{(-)}{\cdot} M_L} \quad [\text{J}]$$

$$Q_v < Q_E \quad [\text{J}]$$

10. Check the selected unit size

in diagram 2 (page 54 friction power diagram).
The point of intersection of friction work (switching work)/cycling frequency must be below the friction power curve!
If it is above, the next size has to be selected and re-calculated from point 3 on.

11. Number of switchings until wear limit

$$Z = \frac{Q_{\text{tot.}}}{* Q_a (Q_v) \times 2} \quad [-]$$

* Q_a/Q_v - put in higher value

Key:

P_A	[kW]	drive power
M_A	[Nm]	drive torque
$M_{\text{req.}}$	[Nm]	required torque
M_L	[Nm]	load torque ($\stackrel{(+)}{\cdot}$ / $\stackrel{(-)}{\cdot}$ = drop load) In case of a load reduce the value in the bracket
M_S	[Nm]	switchable torque (diagram 1, page 54)
n	[rpm]	drive speed
K		safety factor ≥ 2
I	[kgm ²]	mass moment of inertia
I_{own}	[kgm ²]	own mass moment of inertia ("Technical data")
$I_{\text{add.}}$	[kgm ²]	additional mass moment of inertia
t_a	[sec]	acceleration time (input side)
t_v	[sec]	braking time (output side)
$t_1^{(1)}$	[sec]	switching time of the clutch
$t_1^{(2)}$	[sec]	switching time of the brake
$S_{h \max}$	[h ⁻¹]	max. switching frequency per hour (dependent on time)
$Q_{\text{tot.}}$	[J]	total friction work (acc. to Table 4, page 55)
Q_a	[J]	friction work per acceleration
Q_E	[J]	perm. friction work with single switching
Q_v	[J]	friction work per deceleration
t_s	[s]	delay times
Z		number of switchings until wear limit

Table 3,
page 55

Table 4,
page 55

Calculation example

Data:

Input power	$P_A = 0,75 \text{ kW}$
Input speed	$n = 1400 \text{ rpm}$
Load torque output	$M_L = 3,0 \text{ Nm}$
Additional mass moment of inertia	$I_{\text{add.}} = 0,0042 \text{ kgm}^2$
3000 cycles per hour	

Drive torque

$$M_A = \frac{9550 \times P_A}{n} = \frac{9550 \times 0,75}{1400} = 5,1 \text{ [Nm]}$$

Required torque

$$M_{\text{req.}} = K \times M_A = 2 \times 5,1 = 10,2 \text{ [Nm]}$$

Determined unit size acc. diagram 1 = Size 4

$$M_S \geq M_{\text{req.}} = 11 \text{ [Nm]}$$

Mass moment of inertia

$$I = I_{\text{own}} + I_{\text{add.}} = 0,000637 + 0,0042 = 0,00484 \text{ [kgm}^2]$$

Acceleration time input side (lift load) ($M_A \geq M_S$)

$$t_a = \frac{I \times n}{9,55 \times (M_S + M_L)} + *t_1^{(1)} \text{ (clutch)}$$

$$t_a = \frac{0,00484 \times 1400}{9,55 \times (11 - 3)} + 0,065 = 0,153 \text{ [sec]}$$

Braking time output side (drop load)

$$t_v = \frac{I \times n}{9,55 \times (M_S - M_L)} + *t_1^{(2)} \text{ (brake)}$$

$$t_v = \frac{0,00484 \times 1400}{9,55 \times (11 - 3)} + 0,040 = 0,129 \text{ [sec]}$$

* switching times $t_1^{(1)}$ and $t_1^{(2)}$ from Table 3, page 55 = without overexcitation

Max. switching frequency per hour

$$S_{h \text{ max}} = \frac{1}{(t_v + t_a) \times 1,2} \times 3600$$

$$S_{h \text{ max}} = \frac{1}{(0,129 + 0,153) \times 1,2} \times 3600 = 10,638 \text{ [h}^{-1}]$$

Friction work per acceleration

$$Q_a = \frac{I \times n^2}{182,4} \times \frac{M_S}{M_S - M_L}$$

$$Q_a = \frac{0,00484 \times 1400^2}{182,4} \times \frac{11}{11 - 3} = 71,5 \text{ [J]} \leq Q_E$$

Friction work per deceleration

$$Q_v = \frac{I \times n^2}{182,4} \times \frac{M_S}{M_S + M_L}$$

$$Q_v = \frac{0,00484 \times 1400^2}{182,4} \times \frac{11}{11 + 3} = 40,9 \text{ [J]} \leq Q_E$$

Check the selected unit size in the friction power diagram (determine point of intersection Q_a or Q_v to S_h).

(The point of intersection determined in diagram 2 must be located in or under the characteristic curve of the selected unit).

Number of switchings until wear limit

$$Z = \frac{Q_{\text{tot}}}{Q_a \times 2} = \frac{44 \times 10^7}{71,5 \times 2} = 3,08 \times 10^6 \text{ switchings}$$

Technical Explanations

ROBA®-takt clutch brake module

mayr®

Switching Times

The switching times stated in Table 3 have been determined by comprehensive series of tests. They are valid for switching DC-side with nominal air gap and warm coil. Deviations depend on the respective installation situation, ambient temperatures, release path and the type of rectification with which the corresponding clutch is operated.

Switching times	Size						
	3	4	5	6	7		
Without overexcitation	t_{11}	Clutch [sec]	0,010	0,015	0,020	0,030	0,045
	t_1	Clutch [sec]	0,045	0,065	0,080	0,150	0,200
	t_{11}	Brake [sec]	0,006	0,008	0,010	0,015	0,025
	t_1	Brake [sec]	0,035	0,040	0,055	0,100	0,150
	t_2	Clutch [sec]	0,012	0,020	0,045	0,060	0,090
	t_2	Brake [sec]	0,010	0,018	0,030	0,060	0,090
With overexcitation (only switch-on time)	t_{11}	Clutch [sec]	0,003	0,005	0,007	0,010	0,015
	t_1	Clutch [sec]	0,025	0,035	0,040	0,075	0,100
	t_{11}	Brake [sec]	0,002	0,003	0,004	0,006	0,008
	t_1	Brake [sec]	0,020	0,022	0,030	0,050	0,075
Recommended duration of overexcitation [sec]		0,010 ¹⁾	0,010 ¹⁾	0,010	0,015	0,020	
Minimal necessary slope separation	with overexcitation [sec]		0,020	0,025	0,030	0,080	0,120
	without overexcitation [sec]		0	0	0,015	0,050	0,080
Height of the overexcitation = approx. 10 x nominal voltage (current limited)							

Table 3

- 1) In case of operation with overexcitation and high switching frequency (80-100 % of the diagram value), the recommended period of the overexcitation acc. Table 3 must not be exceeded.

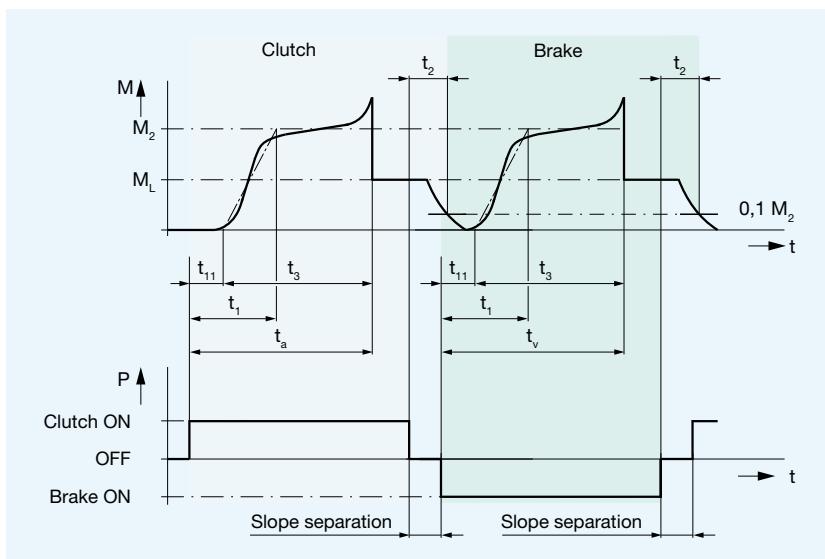

Diagram 3: Torque-time

Friction work	Size					
	3	4	5	6	7	
Permitted friction work for single switching	Q_E [10 ³ J]	3,8	6,2	9	15	25
Total friction work	$Q_{tot.}$ [10 ⁷ J]	22,5	44	87	171	340

Table 4

Please Observe!

Wear values can only be **recommended values** due to operating parameters, such as sliding speed, pressing or temperature.

Application

This unit is used to start, stop and to position by switching and controlling the **mayr® ROBA®-takt** clutch brake modules.

Function

The ROBA®-takt control unit operates according to the principle of a clocked switching controller with a frequency of 18 kHz. Its coil is energised by actuating the sensor for clutch and brake. A temperature monitor protects the unit from overheating. Should the temperature exceed $>80^{\circ}\text{C}$, the coil voltage is switched off. The LED "excess temperature unit" lights up red. A slope separation avoids simultaneous occurrence of clutch and brake torques. On overexcitation, the coil attraction time is reduced, allowing exact switching and positioning.

Electrical Connection

1	Coil connection for clutch	Ku1 / Ku2
2	Coil connection for brake	Br1 / Br2
3	Sensor connection for clutch	+12 V / Ku / Gnd1
4	Sensor connection for brake	+12 V / Br / Gnd2
5	Connection input voltage	PE, L1, N
6	Temperature monitoring	Option 1 (bare)
7	Signalling relay	Option 2 (bare)

Technical Data

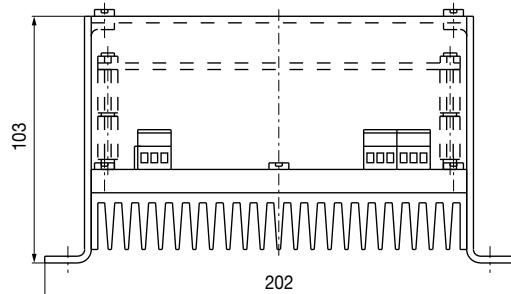

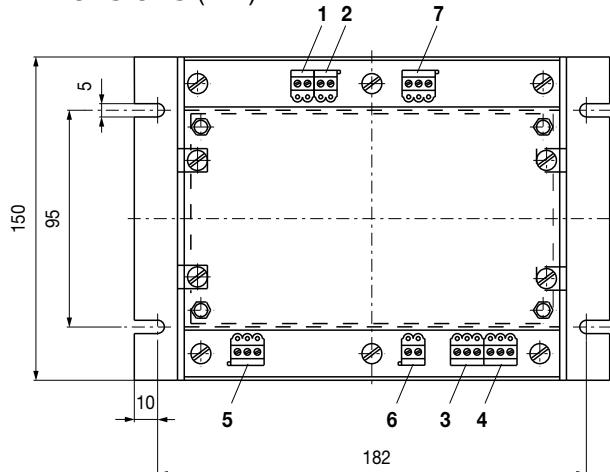

Input voltage	230 VAC $\pm 10\%$, 50-60 Hz
Power input	max. 4 Ampere /100 % duty cycle
No-load supply power	< 7 Watt
Coil _{Nom} -Voltage	24 VDC
Coil _{Nom} -power	maximal 96 Watt
Coil _{Nom} -current	Manufacturer-side setting to mayr® ROBA®-takt-size maximal 325 VDC current limitation is adapted to the respective coil size
Coil overexcitation	2-50 ms (-30 % to +60 %), externally adjustable (only applicable with coding "overexcitation ON")
Overexcitation time	2-150 ms (-25 % to +30 %), externally adjustable
Slope separation	Protection IP20
Protection	Ambient temperature 0 °C to +50 °C
Ambient temperature	Storage temperature -20 °C to +70 °C

Clamping conductor cross section	Weight 1,5 kg / 3,31 lb
Protection fuse Input-side:	F1/F2, (M) 4 A, 5x20mm
G-microfuse	
Protection fuse Coil-side:	F3, the current is adapted to the ROBA®-takt sizes. Always use the same replacement fuses
G-microfuse	two; one for connection to PELV/SELV PELV/SELV (control wires)
Overvoltage category	For installation in <u>overvoltage category III</u>, a suitable overvoltage protection unit is required between the incoming voltage and the ROBA®-takt control unit.
Overvoltage protection	

Control unit temperature monitoring

A fitted temperature switch prevents the control unit from overheating.

ROBA®-takt control unit

Functional Sequence

Connection Example		Connection example 1-sensor operation		Connection example 2-sensor operation	
Control elements / control function					
Control sensor for start and stop	Brake = (Br)	Close contact	Clutch ON	Close contact clutch or	Clutch ON
	Clutch = (Ku)		Brake ON		Brake ON
Application		Function (condition-controlled)		Function (slope-controlled)	
Contact potential-free (NO-Contact)		Close contact	Clutch ON	Close contact clutch or	Clutch ON
		Open contact	Brake ON	Close contact brake	Brake ON
SPS - Control (10 - 30 VDC)		+ 24 VDC signal	Clutch ON	+ 24 VDC signal to clutch or	Clutch ON
		0 VDC signal	Brake ON	+ 24 VDC signal to brake	Brake ON
External voltage (10 - 30 VDC)		+10 - 30 VDC signal	Clutch ON	+10 - 30 VDC signal to clutch or	Clutch ON
		0 VDC signal	Brake ON	+10 - 30 VDC signal to brake	Brake ON
NAMUR Proximity switch (10 - 30 VDC)		Sensor undamped	Clutch ON	Sensor clutch undamped or	Clutch ON
		Sensor damped	Brake ON	Sensor brake undamped	Brake ON
PNP - NC contact Proximity switch (10 - 30 VDC)		Sensor undamped	Clutch ON	Geber Kupplung undamped or	Clutch ON
		Sensor damped	Brake ON	Sensor brake undamped	Brake ON

Application

This device is used to start and stop *mayr® ROBA®-takt* clutch brake modules.
It can be used for alternating 24 VDC coil switching, if a 24 VDC power supply is available.

Function

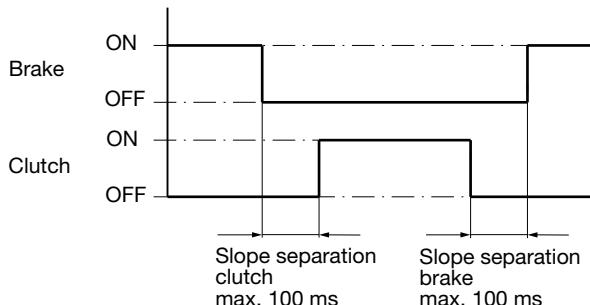

1-sensor operation:	
activated	clutch is energised
deactivated	brake is energised

The respective control of the clutch or brake is indicated via LED.
The ROBA®-takt circuit module has no over excitation function.

The brake has priority: The brake is energised independently of the sensor position when the 24 VDC power supply is switched on. The coil is energised with the 24 VDC power supply.

Slope separation: To avoid simultaneous clutch and braking torques, a slope separation of 0 - 100 ms between clutch and brake can be set, which acts according to the respective rise time and drop-out time of the coils (see switching time table). This adjustment is carried out via the potentiometers Ku = clutch (P2) and Br = brake (P1). The factory default setting is 0 ms.

Electrical Connection (Terminals)

1	Input voltage	24 VDC
2	Input voltage	GND
3 + 4	Brake	
5 + 6	Clutch	
7	Control voltage for switches or sensors	12 VDC
8 + 9	Control inputs	

Technical Data

Input voltage	24 VDC SELV/PELV ripple content ≤ 5%
Recommended fuse	T 4A
Output voltage	24 VDC
Output power	maximal 79 W
Slope separation	0 – 100 ms (factory default setting is 0 ms)
Ambient temperature	0 °C to +70 °C
Storage temperature	-20 °C to +85 °C
Conductor cross section	0,14 - 1,5 mm ² / AWG 26 - 14
Protection	IP00
Design	Printed board with screw-on attachment part or a mounting frame for 35 mm standard mounting rails

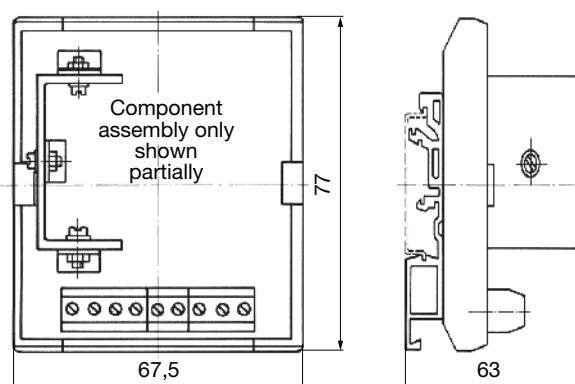

Maximal cycle frequencies		45 °C	70 °C
up to 1 A / sizes 3 + 4	cycles / min	600	600
approx. 2 A / sizes 5 + 6	cycles / min	240	180
approx. 3 A / size 7	cycles / min	120	75

Please Observe!

Higher cycle frequencies will lead to ROBA®-takt circuit module overload and failure.

Safety Clutches/Overload Clutches

- **EAS®-Compact®/EAS®-NC**
Positive locking and completely backlash-free torque limiting clutches
- **EAS®-smartic®**
Cost-effective torque limiting clutches, quick installation
- **EAS®-element clutch/EAS®-elements**
Load-disconnecting protection against high torques
- **EAS®-axial**
Exact limitation of tensile and compressive forces
- **EAS®-Sp/EAS®-Sm/EAS®-Zr**
Load-disconnecting torque limiting clutches with switching function
- **ROBA®-slip hub**
Load-holding, frictionally locked torque limiting clutches
- **ROBA®-contitorque**
Magnetic continuous slip clutches

Shaft Couplings

- **smartflex®**
Perfect precision couplings for servo and stepping motors
- **ROBA®-ES**
Backlash-free and damping for vibration-sensitive drives
- **ROBA®-DS/ROBA®-D**
Backlash-free, torsionally rigid all-steel couplings
- **EAS®-control-DS**
Cost-effective torque-measuring couplings

Electromagnetic Brakes/Clutches

- **ROBA-stop® standard**
Multifunctional all-round safety brakes
- **ROBA-stop®-M motor brakes**
Robust, cost-effective motor brakes
- **ROBA-stop®-S**
Water-proof, robust monoblock brakes
- **ROBA-stop®-Z/ROBA-stop®-silenzio®**
Doubly safe elevator brakes
- **ROBA®-diskstop®**
Compact, very quiet disk brakes
- **ROBA®-topstop®**
Brake systems for gravity loaded axes
- **ROBA®-linearstop®**
Backlash-free brake systems for linear motor axes
- **ROBATIC®/ROBA®-quick/ROBA®-takt**
Electromagnetic clutches and brakes, clutch brake units

DC Drives

- **tendo®-PM**
Permanent magnet-excited DC motors
- **tendo®-SC**
1 quadrant and 4 quadrant transistor controllers
